Raisin64 (*RISC Architecture with In-order Superscalar INterlocked-pipeline*) is a pure 64-bit CPU design created as part of an educational project. Architecturally similar to the [MIPS R10000](#) and [POWER3](#), Raisin64 is a superscalar design that employs multiple specialized pipelines for integer operations, floating point, load/store, etc. Unlike most superscalar designs, Raisin64 does not re-order instructions but instead provides a larger architectural register file of 64x64-bit registers.

Major features of the Raisin64 include:

- **Bits:** 64-bit
- **Design:** RISC
- **Type:** Register-Register
- **Branching:** Condition Code
- **Endianness:** Big
- **Page Size:** 16KB Fixed
- **Virtual Address Size:** 47-Bits
- **Page Table:** Three Level
- **Registers:** 61 (R0 = 0)

5.1.1 Overview

The Raisin64's instruction set draws heavily from MIPS with some concepts graciously borrowed from ARM as well. While the programmer's model and instruction set are decoupled from the underlying microarchitecture of the specific implementation, it was nonetheless decided to design the instructions such that a hardwired control unit (see [TODO:ref:Instruction Decode](#)) could process and set the appropriate signals.

Instructions are variable length (16-64) bit, and some have multiple forms like the [ADD Instruction](#). When an instruction has multiple encodings, the opcode is usually the same between the alternate length versions of that instruction, but in all cases the processor expands the 16 and 32-bit versions of the instruction into their canonical 64-bit form, which has a regular encoding. The general instruction formats and opcodes are described below.

But Why?

There is a natural appeal to 64 registers on a 64-bit machine. This means 6 bits are needed in the instruction format to address each register. While 64-bit instructions allow this and efficient loading of immediate values, they waste program space more often than not. Variable length instructions are a good compromise to avoid the size penalty when not necessary.

5.1.2 Instruction Format

There are TODO instruction formats in Raisin64
