Raisin64 (*RISC Architecture with In-order Superscalar INterlocked-pipeline*) is a pure 64-bit CPU design created as part of an educational project. Architecturally similar to the [MIPS R10000](#) and [POWER3](#), Raisin64 is a superscalar design that employs multiple specialized pipelines for integer operations, floating point, load/store, etc. Unlike most superscalar designs, Raisin64 does not re-order instructions but instead provides a larger architectural register file of 64x64-bit registers.

The various repositories contain the CPU itself,

Major features of the Raisin64 include:

- **Bits:** 64-bit
- **Design:** RISC
- **Type:** Register-Register
- **Branching:** Condition Code
- **Endianness:** Big
- **Page Size:** 16KB Fixed
- **Virtual Address Size:** 47-Bits
- **Page Table:** Three Level
- **Registers:** 61 (R0 = 0)

**RAISIN64 CPU**

**1.1 Overview**

**1.2 Pipeline Stages**

**1.3 Caches**

**1.4 MMU**

**1.5 Interrupt Unit**

**1.6 Debug Unit**

## CODE SNIPPETS AND SOFTWARE

### 2.1 Handling Interrupts

### 2.2 Initializing the MMU

- *Assembler*
- *Debugging*
  - *Getting OpenOCD*

## **3.1 Assembler**

## **3.2 Debugging**

### **3.2.1 Getting OpenOCD**

## **NEXYS 4 DDR REFERENCE IMPLEMENTATION**

### **4.1 SoC Peripherals**

### **4.2 Required Hardware**

### **4.3 Synthesizing the Core**

## INDICES AND TABLES
